

MM5837 Digital Noise Source

General Description

The MM5837 digital noise source is an MOS pseudo-random sequence generator, designed to produce a broadband white noise signal for audio applications. Unlike traditional semiconductor junction noise sources, the MM5837 provides very uniform noise quality and output amplitude. The shift register starts at a random non-zero state when power is applied. The circuit is packaged in an 8-lead plastic DIP.

Features

- Uniform noise quality
- Uniform noise amplitude

- Eliminates noise preamps
- Self-contained oscillator
- Single component insertion

Applications

- Electronic musical rhythm instrument sound generators
- Music synthesizer white and pink noise generators
- Room acoustics testing/equalization
